```

Basic 1

1.1 Default Code

```
#include <bits/stdc++.h>
#define int long long
#define endl '\n' // 如果是互動題要把這個註解掉
// #pragma GCC target("popcnt")
// #pragma GCC optimize("03")
using namespace std;
int tt = 1:
void pre() {
 cout.tie(nullptr); // 輸出加速
 cin >> tt; // 多筆輸入
void solve() {}
signed main() {
 ios_base::sync_with_stdio(false);
  cin.tie(nullptr);
#ifdef LOCAL
  // g++ -DLOCAL -std=c++17 <filename> && ./a.out
 freopen("input.txt", "r", stdin);
// freopen("output.txt", "w", stdout);
#endif // LOCAL
 pre();
  while (tt--) { solve(); }
  return 0:
```

1.2 PBDS

```
#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
using namespace __gnu_pbds;
using namespace std;
template
    <class T> using Tree = tree<T, null_type, less<T
   >, rb_tree_tag, tree_order_statistics_node_update>;
如果有 define int long long 記得拿掉
Tree<int> t 就跟 set<int> t 一樣,有包好 template
rb_tree_tag 使用紅黑樹
第三個參數 less < T > 為由小到大, greater < T > 為由大到小
```

```
插入 t.insert(); 刪除 t.erase();
t.order_of_key
   (k); 從前往後數 k 是第幾個 (0-base 且回傳 int 型別)
t.find_by_order(k);
   從前往後數第 k 個元素 (0-base 且回傳 iterator 型別)
t.lower bound
   (); t.upper_bound(); 用起來一樣 回傳 iterator
可以用 Tree<pair<int, int>> T 來模擬 mutiset
1.3 int128 Input Output
```

```
// 抄 BBuf github 的
#include <bits/stdc++.h>
using namespace std;
 void scan(__int128 &x) // 輸入
{
   int f = 1;
   char ch;
  if((ch = getchar()) == '-') f = -f;
else x = x*10 + ch-'0';
   while((ch = getchar()) >= '0' && ch <= '9')</pre>
    x = x*10 + ch - '0';
   x *= f;
}
 void print(__int128 x) // 輸出
   if(x < 0)
   {
     x = -x;
     putchar('-');
   if(x > 9) print(x/10);
   putchar(x%10 + '0');
}
 int main()
    _int128 a, b;
   scan(a);
   scan(b);
   print(a + b);
  puts("");
  print(a*b);
   return 0;
}
```

1.4 Python

```
## Input
# p q 都是整數,中間以空白分開輸入
p, q = map(int, input().split())
# 輸入很多個用空
    白隔開的數字,轉成 float 放進陣列,s 是 input 字串
arr = list(map(float, s.split()))
# 分數用法 Fraction(被除數,除數)
from fractions import Fraction
frac = Fraction(3, 4)
numerator = frac.numerator # 取出分子
denominator = frac.denominator # 取出分母
arr = [Fraction
    (0), Fraction(1, 6), Fraction(1, 2), Fraction(5,
     12), Fraction(0), Fraction(-1, 12), Fraction(0)]
# 可以直接做乘除
def fx(x):
   x = Fraction(x)
    ans = Fraction(0)
    for i in range(1, 7):
    ans += arr[i] * x ** (7 - i)
    return ans
```

2 Math

2.1 質數表

```
vector<int> prime table(int n){
  vector<int> table(n + 1, 0);
  for(int i = 1; i <= n; i++){</pre>
    for(int j = i; j <= n; j += i){</pre>
      table[j]++;
    }
 }
  return table;
```

2.2 快速冪

```
#define int long long
// 根據費馬小定
   理,若 a p 互質,a^{(p-2)} 為 a 在 mod p 時的乘法逆元
// a ^ (b ^ c
   ) % mod = fast_pow(a, fast_pow(b, c, mod - 1), mod)
typedef unsigned long long ull;
inline int ksc(ull
    x, ull y, int p) { // O(1)快速乘(防爆long long)
  return (x
     * y - (ull)((long double)x / p * y) * p + p) % p;
inline int fast_pow(int a, int b, int mod)
  // a^b % mod
  int res = 1;
 while(b)
   if(b & 1) res = ksc(res, a, mod);
   a = ksc(a, a, mod);
   b >>= 1;
 }
  return res;
```

2.3 擴展歐幾里得

```
int gcd(int a, int b)
  return b == 0 ? a : gcd(b, a % b);
int lcm(int a, int b)
  return a * b / gcd(a, b);
}
pair<int, int> ext_gcd
   (int a, int b) //擴展歐幾里德 ax+by = gcd(a,b)
 if (b == 0)
   return {1, 0};
  if (a == 0)
   return {0, 1};
 int x, y;
 tie(x, y) = ext_gcd(b % a, a);
 return make_pair(y - b * x / a, x);
```

2.4 矩陣

```
// 矩陣乘法 (A * B) % mod
template <typename T>
vector<vector<T>> matrix_mult(const vector<</pre>
    vector<T>>& A, const vector<vector<T>>& B, T mod) {
  int m = A.size();
  int n = A[0].size();
  int p = B[0].size();
  assert(A[0].size() == B.size());
  vector<vector<T>> result(m, vector<T>(p, 0));
for (int i = 0; i < m; ++i) {</pre>
    for (int j = 0; j < p; ++j) {
      for (int k = 0; k < n; ++k) {</pre>
        result[i][j]
             = (result[i][j] + A[i][k] * B[k][j]) % mod;
    }
  return result;
```

2.5 Miller rabin Prime test

```
|// fast_pow 去前面抄,需要處裡防暴乘法
|// 記得 #define int long long 也要放
// long long 範圍內測試過答案正確
// time: O(logn)
 inline bool mr(int x, int p) {
  if (fast_pow(x, p - 1, p) != 1) return 0;
   int y = p - 1, z;
   while (!(y & 1)) {
      y >>= 1;
       z = fast_pow(x, y, p);
if (z != 1 && z != p - 1) return 0;
       if (z == p - 1) return 1;
   return 1;
 inline bool prime(int x) {
   if (x < 2) return 0;</pre>
   if (x == 2 ||
       x == 3 \mid \mid x == 5 \mid \mid x == 7 \mid \mid x == 43) return 1;
   // 如果把 2
      到 37 前 12 個質數都檢查一遍 可以保證 2^78 皆可用
   return mr(2, x)
       && mr(3, x) && mr(5, x) && mr(7, x) && mr(43, x);
```

2.6 Pollard's Rho

```
|// 主函數記得放 srand(time(nullptr))
// prime 檢測以及快速冪, gcd 等請從前面抄
// 輸入一個數字 p,隨
    機回傳一個 非 1 非 p 的因數,若 p 是質數會無窮迴圈
#define rg register int
inline int rho(int p) {
  int x, y, z, c, g;
  rg i, j;
  while (1) {
    y = x = rand() % p;
    z = 1;
    c = rand() % p;
    i = 0, j = 1;
    while (++i) {
      x = (ksc(x, x, p) + c) \% p;

z = ksc(z, abs(y - x), p);
      if (x == y || !z) break;
      if (!(i % 127) || i == j) {
        g = gcd(z, p);
        if (g > 1) return g;
        if (i == j) y = x, j <<= 1;
      }
    }
  }
}
 // 回傳隨機一個質因數,若 input 為質數,則直接回傳
int prho(int p){
  if(prime(p)) return p;
  int m = rho(p);
  if(prime(m)) return m;
  return prho(p / m);
 // 回傳將 n 質因數分解的結果,由小到大排序
// ex: input: 48, output: 2 2 2 2 3
vector<int> prime_factorization(int n){
  vector<int> ans;
  while(n != 1){
    int m = prho(n);
    ans.push_back(m);
    n /= m;
  sort(ans.begin(), ans.end());
  return ans;
```

2.7 皮薩諾定理

```
| // fib(x) % m = fib(x + kn) % m 當 k >= 1, 求 n
// n 為費式數列 % m 會重複的週期
// pisano_period(m) <= 6m
```

```
// 通常這都要本地跑
#define int long long
int pisano_period(int m) {
  int pre = 0, cur = 1;
  int temp;
  for (int i = 0; i < m * m; i++) {
    temp = pre;
    pre = cur;
    cur = (temp + cur) % m;
    if (pre == 0 && cur == 1) return i + 1;
  }
  return 0;
}</pre>
```

2.8 高斯消去法

```
from fractions import Fraction
def gauss_elimination(matrix, results):
    # 將所有數字轉換為分數
   n = len(matrix)
    augm = [[Fraction(matrix
    [i][j]) for j in range(n)] for i in range(n)]
augr = [Fraction(results[i]) for i in range(n)]
    # 高斯消去法
    for i in range(n):
        # 尋找主元
        if augm[i][i] == 0:
            for j in range(i + 1, n):
               if augm[j][i] != 0:
                    augm[i], augm[j] = augm[j], augm[i]
augr[i], augr[j] = augr[j], augr[i]
        pivot = augm[i][i]
        if pivot == 0:
            # 如果主元為0,繼續檢查該行是否全為 0
            if all(augm[i][j] == 0 for j in range(n)):
                if augr[i] != 0:
                    return None
                                 #無解
                    continue
                          # 可能有無限多解,繼續檢查
        # 將主元行的數字規一化
        for j in range(i, n):
            augm[i][j] /= pivot
        augr[i] /= pivot
        # 將其他行的數字變為0
        for j in range(n):
            if i != j:
                factor = augm[j][i]
                for k in range(i, n):
                    augm[j][k] -= factor * augm[i][k]
                augr[j] -= factor * augr[i]
    # 檢查是否存在無限多解的情況
    for i in range(n):
        if all(augm[i][j
            ] == 0 for j in range(n)) and augr[i] == 0:
            return [] # 無限多組解
    return augr
 matrix = [
     [2, -1, 1],
     [3, 3, 9],
[3, 3, 5]
# 1
 results = [8, -42, 0]
 output = [
    Fraction(12, 1), Fraction(11, 2), Fraction(-21, 2)]
# Fraction 可以強轉 float
import numpy as np
def gauss_elimination(matrix, ans):
   matrix = np.array(matrix)
    ans = np.array(ans)
```

```
try:
    solution = np.linalg.solve(matrix, ans)
    return [f"{value:.2f}" for value in solution]
    except np.linalg.LinAlgError:
    # 無解或者無限多組解
    return "No Solution"

# 有開放 numpy 可以用
# 優點: 行數短,執行速度快
# 缺點: 只能用浮點數,無法區分無解及無限多組解

2.9 卡特蘭數
```

從左下到右上的路徑中,永不超過對角線的路徑有幾種 一個 stack 在 push 順

序不變的情況下 (1, 2, 3, ..., n), 有幾種 pop 的方式 在圖上選擇 2 * n 個

點,將這些點兩兩連接使得 n 條線段不相交的方法有幾種

```
n = int(input())

catalan = [1 for _ in range(n + 1)]

for i in range(1, n + 1):
    catalan
        [i] = catalan[i - 1] * (4 * i - 2) // (i + 1)

ans = 0

for i in range(0, n + 1): # 卡特蘭數的平方
    ans += catalan[i] * catalan[n - i]

print(ans)
# 185ms in codeforces, n <= 5000
```

2.10 中國剩餘定理

```
int exgcd(int a, int b, int &x, int &y) {
  if (!b) {
   x = 1, y = 0;
    return a;
  int g = exgcd(b, a \% b, y, x);
  y -= a / b * x;
  return g;
}
int inv(int x, int m) {
  int a, b;
  exgcd(x, m, a, b);
  a %= m;
  if (a < 0) a += m;
  return a;
// 求解 x = г1 % m1 = г2 % m2 = г3 % m3...
// a[i] = {{remain, mod}, ...}
// notice: 如出現極限測資(1e18),需開 int128
int CRT(vector<pair<int, int>> &a) {
  int s = 1, ret = 0;
for (auto &[r, m] : a) s *= m;
  for (auto &[r, m] : a) {
    int t = s / m;
    ret += r * t % s * inv(t, m) % s;
    if (ret >= s) ret -= s;
```

```
return ret;
}
```

Graph

3.1 DSU

3

```
class dsu{
  public:
    vector<int> parent;
    dsu(int num){
      parent.resize(num);
      for(int i = 0; i < num; i++) parent[i] = i;
    }
    int find(int x){
      if(parent[x] == x) return x;
      return parent[x] = find(parent[x]);
    }
    bool same(int a, int b){
      return find(a) == find(b);
    }
    void Union(int a, int b){
      parent[find(a)] = find(b);
    }
};</pre>
```

3.2 Dijkstra

```
// 傳入圖的 pair 為 {權重,點},無限大預設 1e9 是情況改
#define pii pair<int, int>
vector<
    int> dijkstra(vector<vector<pii>>> &graph, int src){
  int n = graph.size();
 vector<int> dis(n, 1e9);
 vector<bool> vis(n, false);
 priority_queue<pii, vector<pii>, greater<pii>> pq;
 pq.push({0, src});
 dis[src] = 0;
 while(!pq.empty()){
    auto [w, node] = pq.top();
    pq.pop();
    if(vis[node]) continue;
    vis[node] = true:
    for(auto [nw, nn]:graph[node]){

7 Dynamic Programing

7.1 LCS

7.2 LIS

```
int LIS(vector<int>& save) {
  vector<int> dp;
  int n = save.size();
  for (int i = 0; i < n; i++) {
    auto it = lower_bound(dp.begin(),dp.end(),save[i]);
    if(it == dp.end()) dp.push_back(save[i]);
    else *it = save[i];
  }
  return dp.size();
}</pre>
```

7.3 Knapsack

```
* 背包問題:
 * 1. dp[i][j]: 考慮 1~i 個物品,重量為 j 時的最大價格
 * 2. dp[i][j]: 考慮 1~i 個物品,價值為 j 時的最小重量
// 當重量比較輕時 O(nw)
vector<int> dp(sum + 1, 0);
for (int i = 1; i <= n; ++i) {
  for (int j = sum /* bound */; j >= weight[i]; --j) {
    if (dp[j] < dp[j - weight[i]] + price[i]) {
  dp[j] = dp[j - weight[i]] + price[i];</pre>
      backtrack[i][j] = 1;
    }
  }
}
// 當重量比較重時 O(nc)
vector<int> dp(sum + 1, 1e9 + 7);
dp[0] = 0;
for (int i = 1; i <= n; ++i) {</pre>
  for (int j = sum /* bound */; j >= price[i]; --j) {
    if (dp[j] > dp[j - price[i]] + weight[i]) {
      dp[j] = dp[j - price[i]] + weight[i];
      backtrack[i][j] = 1;
    }
  }
}
// backtrack: 找到當 bound 為 k 時, 背包內有哪些東西
// 註:只找到其中一種
int l = n, r = k;
vector<int> ans;
while (l != 0 && r != 0) {
  if (backtrack[l][r]) {
    ans.push back(l);
    r -= weight[l]; // 當用方法一時,用這行
    r -= price[l]; // 當用方法二時,用這行
  l - -;
}
```

7.4 位元 dp

```
|// 檢查第 n 位是否為1
if(a & (1 << n))
|// 強制將第 n 位變成1
a |= (1 << n)
|// 強制將第 n 位變成0
a &= ~(1 << n)
|// 將第 n 位反轉(1變0, 0變1)
a ^= (1 << n)
|// 第 0 ~ n - 1位 全部都是1
|// 兩個集合的聯集
S = a | b
|// 兩個集合的交集
S = a & b
```

7.5 經典 dp 轉移式

```
|/*
|最大區間和:
| dp[i] 代表 由第 i 項結尾時的最大區間和
| dp[0] = arr[0]
| dp[i] = max(dp[i - 1], arr[i])
| ans = max_element(dp)
| */
```

8 Divide and conquer

8.1 逆序數對

```
int merge(
  vector<pair<int, int>>& v, int l, int mid, int r) {
vector<pair<int, int>> temp(r - l + 1);
  int i = l, j = mid + 1, k = 0, inv_count = 0;
  while (i <= mid && j <= r) {
    if (v[i].second <= v[j].second) {</pre>
           temp[k++] = v[i++];
           temp[k++] = v[j++];
           inv_count += (mid - i + 1);
       }
  while (i <= mid) temp[k++] = v[i++];
  while (j <= r) temp[k++] = v[j++];</pre>
